

CIRCULAR REGULATORS WITH VARIABLE AIR FLOW

CL-VRC
SERIES

OVERVIEW

Overview :

The CL-VRC series of variable flow regulators are regulation units to be used in single duct systems. These regulators are used to control and maintain the air quantity in the systems with variable air flow. The tightness of the blade assures class 3 as per EN 1751.

Technical characteristics:

The CL-VRC regulators are assembled from:

- circular casing in galvanized steel from 100 up to 400 mm diameters equal to the standard circular air ducts.
- regulation damper in galvanized steel with hold gaskets to guarantee the maximum linearity in the regulation and level of minimal noise.
- Dynamic Δp probe for the measure and maintenance of the flow of air in relation to that requested in the room.
- motor regulator in linear with the regulation and control of the flow.

Applications:

The CL-VRC series regulators are used to supply a variable flow of air to the room to be conditioned, in relation to the variation of its thermal loads so as to maintain the maximum thermal comfort conditions. The auto-generated and irradiated noise tests have been carried out to EN ISO 3741 standards.

Text for tender:

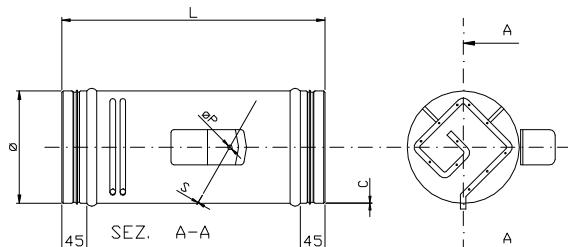

Circular regulator with variable air flow for single duct for supply or extraction of air model CL-VRC manufactured by MP3 Srl, made in galvanized steel complete of differential pressure detector, temperature probe, regulator and actuator.

Accessories :

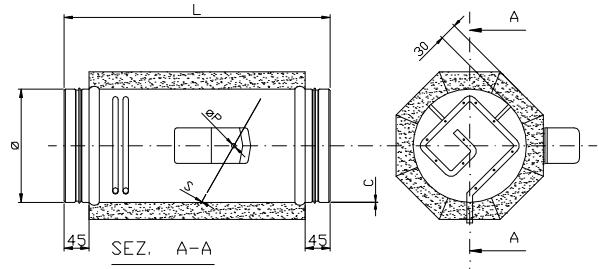

- double casing
 - equalizing net to be installed at the entrance to better spread the flow of air
 - additional silencer L=500mm or L=1000mm
- The regulators are supplied, as standard, complete with motors from our test benches according to customer request.

For requests without motor, that will in any case have to be calibrated and applied by the customer, MP3 can not in any way guarantee the correct functioning of the apparatus.

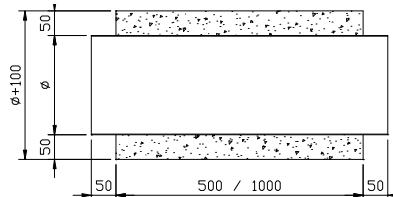

Variable air flow regulator CL-VRC-N

Variable air flow regulator with double casing CL-VRC-I

Additional silencer CL-VSC

Main dimensions :

Ø (mm)	Ø P (mm)	S (mm)	L (mm)	C (mm)
100	8	0,6	370	0,8
125	8	0,6	370	0,8
160	8	0,6	415	0,8
200	8	0,6	470	0,8
250	8	1,2	540	0,8
315	12	1,2	630	0,8
355	12	1,2	685	0,8
400	12	1,2	750	0,8
500	12	1,2	820	0,8
630	120	1,2	920	0,8

Executions :

With motor:

- Siemens GDB 181.1/E3/MP;
 - Belimo NMV-D3-MP;
 - Belimo LMV-D3-MP;
 - Belimo NM24AV + reg. VRD3;
 - other motor types to be agreed at quotation stage.
- Possibility of fitting for use in extraction with control of the static room Δp to guarantee negative or positive pressures in relation to the use of the room.

CIRCULAR REGULATORS WITH VARIABLE AIR FLOW

WORKING PRINCIPLES

CL-VRC
SERIES

WORKING PRINCIPLE "INDEPENDENT PRESSURE"

The regulation of the air flow is made by a dynamic pressure control system that can guarantee "the initial independence of the pressure". In so doing, all the requested air flow variations will not disturb the other air flows of other uses.

The control system is comprised of the following elements:

- Air flow measuring element (probe for dynamic Δp).
- Regulation element (the air flow regulator) that receives actual information relative to the measurement of the flow of air and to the request from the room.
- This regulator analyses the difference between the true measurement and that needed in the room so as to transmit a command to a specific motorised unit (the damper) that acts on the flow of air so as to obtain the final requested value by closing in the event of excess and opening in the event of lack of air.
- In the case of variable flow, the set point of the flow is variable from a maximum to a minimum value in relation to the regulation of the temperature;
- The system will always work so as to work the requested air flow in that moment to satisfy the room requirements.

COMMAND SIGNALS USED

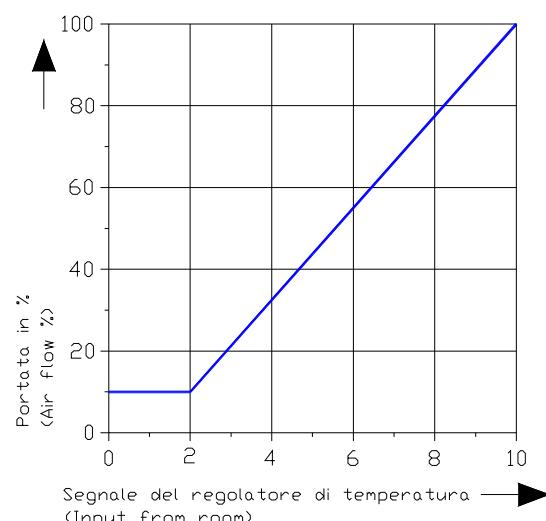

When ordering, it is necessary to specify the type of signal that will be used for the adjustment.

The used signals are

- Signal 0V-10V;
- Signal 0V-10V with separate control of total closure;
- Signal 2V-10V;
- Signal 2V-10V with separate control of total closure;
- Signal 2V-10V with total closure to 0V.

ENVIRONMENTS IN PRESSURE OR DEPRESSION

In this type of environments it is possible to control the adjustment in recovery via a differential pressure sensor to ensure the overpressure or depression prescribed independently of the flow and the presence of other air outlet, for example in the presence of hoods or frequent opening of the door of access to the room.

CIRCULAR REGULATORS WITH VARIABLE AIR FLOW

PERFORMANCE

CL-VRC
SERIES

Regulator calibration

For the calibration of the regulator CL-VRC it will be necessary to indicate the maximum and minimum flows requested for the intended use.

The maximum air flow must be between the two values indicated in the table.

The minimum air flow must be greater or equal to the value indicated in the table

Furthermore, it will be necessary to indicate the signal given from the sensor of the room temperature; 0-10V, 2-10V, three point or other.

When necessary, it will be necessary to indicate the side on which it is required to install the controls in relation to the flow of air. In the absence of this information, the controls will be fitted on the right hand side in relation to the direction of the flow of air.

Installation arrangements:

for a correct reading of the performances and for a air flow tolerance of 5%, it is necessary at the source to supply a straight section of duct of a length equal to three times the dimension of the larger size of the regulator. In the opposite case, the air flow may be affected by a variation between 10% and 20% in comparison to the calibrated value.

Pressure losses through a closed damper :

The air tight gasket, fitted on the perimeter of the damper, can maintain a level of pressure loss through it below 0.1% of the nominal air flow, with a maximum pressure of 1000 Pa.

The tightness of the blade assure class 3 as per EN 1751

RANGE OF REGULATION OF THE AIR FLOW		
Diametro (mm)	Q min (m ³ /h)	Q max (m ³ /h)
100	>35	75÷280*
125	>60	115÷430*

ACCESSORI

WARNING
There is no set standard motor, the required motor must always be specified.
For guidance in the choice of the motor, contact our Sales Department

CL-VML Sensore di pressione differenziale Belimo VFP 300

CL-VMG Centralina Belimo VRP M per gestione dati di pressione differenziale

CL-VMF motore Belimo LMQ24A-SRV-ST per sistemi in ripresa

L'uso di **CL-VML + CL-VMG + CL-VMF** in apparecchiature in ripresa consente la gestione di ambienti in sovrappressione o depressione con ΔP fino a 300Pa
